

## Burndown Chart

The sprint was similar to the last sprint where most of the tasks are done towards the end of the sprint. Again most group members have significant workload in all of their courses so the progress on the project is very slow. There is also the fact that subtasks are not displayed with regard to the burndown chart, which means that for tasks that have a large number of subtasks will only be tracked as complete when all of the subtasks are done. This also leads to the graph ending up as shown even though large amounts of subtasks are already completed.
